Erſter Abſchnitt.

Die Veranlaſſungsgründe zu dieſer Unterſuchung und Abhandlung.

Gegenwärtige Blätter ſind der Unterſuchung gewidmet, ob es eigentliche Zahnwürmer gebe oder nicht? Ehe ich aber zu dieſer Abhandlung ſchreite, erachte ich nicht undienlich zu ſeyn, vorhero in Kürze anzuzeigen, was die entfernte und nähere Veranlaſſung zu derſelben gegeben habe.

So edel die Arzneykunſt iſt: ſo wenig iſt zu leugnen, daß ſolche noch lange nicht zu dem Grade der Vollkommenheit gediehen ſey, welcher derſelben zu wünſchen wäre. Es iſt hier der Ort nicht, die Urſachen davon zu unterſuchen. Es mögen aber ſolche ſeyn, welche ſie wollen, ſo erhellet ſo viel, daß dem menſchlichen Geſchlechte derjenige allzeit einen ſehr heilſamen Dienſt erzeige, welcher in einer Wiſſen-

schaft, die dasselbe und dessen Erhaltung so genau angehet, Vorurtheile hebet, Irrthümer zeiget, das Zweifelhafte in mehrere Gewisheit bringet, und die Wahrheit aufkläret. Und es wird also keines Beweises bedürfen, daß die allgemeine Menschenliebe, wenn jemand, er sey, welchen Standes er wolle, dieses auch nur in einem Stücke zu leisten vermögend ist, solchen verbinde, der Welt seine Versuche, Erfahrungen, Entdeckungen und Aufklärungen mitzutheilen. Dieses ist die erste entfernte Veranlassung dieser Blätter.

Die zweyte hat ihre Beziehung mehr auf das Allgemeine der Wissenschaften, und sonderlich der Naturkunde. Es ist bekannt, zu was vor einem Ansehen und Beweisgrunde die Erfahrungssätze in unsern Tagen gelanget sind, wie sie gar oft auch den Vernunftsgründen, und noch mit grösserm Rechte demjenigen vorgezogen werden, was blos willkührlich angenommen, und nach dem Satze der Aehnlichkeit, des Wahrscheinlichen und der Muthmassungen behauptet werden will. Allein, dem ohngeachtet, machen Versuche und Erfahrungen die Sache an sich nicht aus. Sie müssen, wenn sie giltig seyn sollen, gewisse Eigenschaften haben, und nach gewissen Regeln behandelt und beurtheilet werden. Geschiehet dieses nicht, so können sie eben sowohl, als irgend etwas anders, eine Quelle vieler Irrthümer, übereilter Urtheile und falscher Schlüsse werden. Und sollte nicht dieß die Ursache seyn, warum man noch heutigen Tages in den Schriften der berühmtesten Naturlehrer manche Widersprüche findet, da der eine verneinet, was der andere behauptet; ein Jeder aber sich gleichwohl auf Versuche und Erfahrungen berufet?

Soll also dieses Letztere vermieden werden, und sollen Erfahrungen und Versuche sicher zur Wahrheit führen, so wird, wie mich dünket, dabey ohngefähr auf folgende Weise zu verfahren seyn. Ein Jeder wird seine Versuche ohne alle vorgefaßte Meynung zur Hand nehmen

men müssen. Er wird mit der größten Sorgfalt dabey zu Werke zu gehen, alle Nebenumstände anzumerken und sein ganzes Verfahren umständlich aufzuzeichnen haben. Er wird einen Versuch zu wiederholtenmalen und zu verschiedenen Zeiten vorzunehmē, auch wohl von einem Dritten oder Mehreren nach machen zu lassen, sich nicht dürfen gereuen lassen. Er wird endlich bey öffentlicher Bekantmachung seiner Versuche nicht zu vergessen haben, sowohl die Hauptsachen, als auch die Beschaffenheit der Luft und des Wetters, den Grad der Wärme und der Kälte, und jeden geringscheinenden Handgriff genau anzugeben. Ich bin versichert, auf diese Weise werden Versuche und Erfahrungen selten und gar nicht trügen; sie werden, wenn sie auch noch so oft auf die Probe gestellet werden sollten, sich jedesmal in ihrer Stärke und ohne Widerspruch zeigen; sie werden der sicherste Leitfaden zur Wahrheit und zu allerhand Entdeckungen seyn. Und auch von diesen Sätzen soll meine gegenwärtige Abhandlung eine Erläuterung und Bestättigung seyn.

Ich komme nunmehr auf die nähere Veranlassung, welche folgende ist. Eine hiesige Person vom Stande hatte einige Tage hintereinander unleidentliches Zahnwehe. Alle dagegen gebrauchte Mittel schafften so wenig die geringste Linderung, daß vielmehr das Uebel je länger je mehr zunahm. Endlich ward von Jemand angerathen, sich auf eine besondere Art mit Judenkirschen zu räuchern. Man versicherte, daß man dieses an sich und andern, als ein bewährtes Mittel befunden habe. Ja man gab davon die Ursache an, und zwar in der Maaße, daß das Zahnwehe von nichts als Würmern herkäme, die in den Zähnen sich befänden, und durch ihr Nagen den Schmerz verursachten; die aber durch dieses Mittel nicht nur getödtet, sondern auch aus den Zähnen abgetrieben würden. Und daß dieses Letztere wirklich geschehe, ward ferner deßwegen bekräftiget, weil, wenn man sich gedachten Mittels auf die vorgeschriebene Art bediene, man die getöd-

teten und abgetriebenen Würmer hauffenweise im Wasser finden werde.

Dieser Vortrag hatte die Wirkung, daß sich die gedachte Standsperson entschloß, das Mittel zu versuchen. Sie dachte, daß wenigstens dasselbe ganz unschuldig sey, und daraus doch aufs mindeste kein Nachtheil erfolgen könne. Das Mittel wurde also gebraucht, und zwar auf folgende Weise.

Man nahm einen irdenen Topf oder Hafen *, und machte in demselben drey besondere, in die Quere lauffende mehr breite, als lange, Oeffnungen **, die eine im Boden, und die andern zwo auf den Seiten, und zwar so, daß letztere gegeneinander gerichtet waren. Man nahm hierauf eine Schüssel, in welcher sich reines und helles Wasser befand ***. In dieses stellte man den Topf umgekehrt also, daß die Oeffnung im Boden oben zu stehen kam. Nach diesem wurde ein etwas breites Eisen, so in die Seitenöffnungen des Topfes paßte, und mit einer Handhabe versehen war †, ins Feuer geleget, und in demselben, sonderlich gegen die Mitte, so glüend gemacht, als es nur möglich war. Bis solches erfolgte, nahm man zwo, bis drey, trokene Judenkirschen, drukte sie auseinander, vermengte sie mit reinem und weißem Wachse, so man über Kohlen hatte etwas weich werden lassen, und machte aus beyden ein plattgedruktes Kügelgen. Nachdem indessen das erstgedachte Eisen glühend geworden war, legte man dieses aus Judenkirschen und Wachse verfertigte Kügelgen behutsam auf den Ort, wo das Eisen am stärksten glühete, und fuhr damit ellends durch die eine Seitenöffnung des Topfes so weit hinein, daß das Eisen zur andern Seitenöffnung wieder herausgieng, welches nachher auf dem untern Rande jeder Oeffnung ruhete, das Kügelgen aber ohngefähr in der Mitten zu liegen kam.

Gewis

* Fig. XII. a. ** c. d. *** f. f. † b. b.

Digitized by Google

Gewis besondere Anstalten! Wir werden uns in der Folge darüber um so mehr verwundern müssen, wenn ich erweisen werde, daß der geringste Umstand hiebey seinen zureichenden Grund habe, und daß alles recht mathematisch eingerichtet sey. Allein, dieß ist gleichwohl noch nichts gegen den Erfolg dieser seltsamen Zubereitung.

Denn, nachdem das Wachs geschmolzen war, und die darunter vermengte Judenkirschen zu brennen anfiengen, so sahe man den davon entstehenden, und nicht gar angenehm riechenden, Rauch zu der obern Oeffnung stark herausfahren. Man hielt den Mund, und sonderlich die Gegend desselben, wo der wütende Zahn sich befand, über diese Oeffnung, und ließ nicht nur den Rauch so lang daran gehen, als er vorhanden war; sondern man suchte auch eine solche Leibesstellung anzunehmen, damit der, von diesem Rauche erregte, stärkere Zufluß des Speichels durch die obere Oeffnung des Topfes in das Wasser fallen könnte. Die ganze Cur war in Zeit von weniger als vier und fünf Minuten vorbey. O! welch eine Freude. Der Schmerz war zugleich auch weg; man war nach so vieltägigen und so gar unmenschlich erlittenen Schmerzen auf einmal, wie neugebohren! Ja was noch mehr. Als man den Topf in die Höhe nahm, so erstaunte man über den Anblick im Wasser. Hier lagen, wie es vorher gesaget worden war, die getödteten und abgetriebenen Würmer wirklich bey Hauffen *. Mit einem Worte: **Es hatte geholfen, und die Würmer waren die sinnlichsten Zeugnisse der fürtreflichen Wirkung dieses so geringscheinenden Mittels.**

Dieser Cur hatte noch eine andere Person beygewohnet. Diese wollte zwar nicht in Ansprache nehmen, daß sich durch das gebrauchte Hülfsmittel das Zahnwehe, wenigstens vor erst, mögte verloren haben. Allein die Würmer wollten gar nicht ihren Beyfall erhalten; und sie

* Fig. I.

machte dagegen einige gar gute Zweifel. Jedoch dieſe Perſon wurde von den Uebrigen bald überſchrien. Man wieß alle dagegen vorgebrachte Einwürfe kurz und gut damit ab: Das Mittel habe doch geholfen, und die Würmer ſeyen vor Augen. Endlich gab dieſe unglaubige Perſon nach, und bath ſich von der Standsperſon, um hinter die Wahrheit zu kommen, nur dieſes aus, daß man dieſe vorgeblichen Würmer von Jemand andern mögte genauer unterſuchen laſſen. Man erwählte mich zum Schiedsrichter; und ſchikte mir in einem mit Waſſer angefüllten Gläsgen einige derſelben, mit Bitte, daß ich aus Liebe zur Wahrheit, ſowohl überhaupt, als ſonderlich vermittelſt der Vergrößerung, unterſuchen mögte, ob es dann wahre Würmer wären.

Als mir dieſe Würmer überbracht worden waren, hatte ich eben keine Zeit ſie genau zu unterſuchen. Jedoch kamen ſie mir gleich im erſten Anblicke allerdings beſonders vor, ja ſie ſchienen mir ſelbſt wahre und wirkliche Würmer zu ſeyn. Nebſt dem erinnerte ich mich, in den Schriften der Naturlehrer und Aerzte hin und wieder von Würmern in Zähnen geleſen zu haben. Daher ließ ich vor der Hand nur ſo viel zurück wiſſen: daß, wie ſich aus dem erſten Anblicke und dem bloſen Augenſcheine abnehmen ließe, dieſe Körper allerdings das Anſehen und die Geſtalt ordentlicher Würmer hätten; doch würde ſich erſt bey genauerer Prüfung und Zergliederung ausweiſen, ob der Augenſchein und die Sinnen nicht geblendet hätten.

Zweyter Abschnitt.

Die mit den angeblichen Zahnwürmern, und sonst gemachten Versuche, in so fern sie die Meynung zu bestärken scheinen, daß es eine Gattung eigentlicher und wahrer Würmer sey.

Nachdem ich in dem vorhergehenden Abschnitte die Veranlassung dieser Blätter umständlich angeführet habe; so wende ich mich nun zur Sache selbst, nämlich zur Prüfung, ob es eigentliche Zahnwürmer gebe? Ich werde die Versuche beyzubringen haben, welche deswegen von mir angestellet worden sind. Und, um ordentlich dabey zu verfahren, werde ich im gegenwärtigem Abschnitte nur desjenigen gedenken, was diesen Gegenstand zu bestättigen und außer allem Zweifel zu setzen scheinet.

Als ich an dem nämlichen Tage, da mir die mehrgedachten Zahnwürmer waren überbracht worden, noch einige Zeit gewann, mich mit denselben zu beschäftigen; so war das Erste, daß ich in den Schriften der Naturlehrer und berühmter Aerzte nachsahe, wohin ihre Gedanken und Beschreibungen von Würmern in Zähnen gehen mögten, um desto besser mit denenjenigen eine Vergleichung anzustellen, welche ich vor mir hatte. Allein ich fand, wie es in dergleichen besondern Fällen insgemein zu gehen pfleget, bey nahe überall schlechten Trost, wenigstens das gar nicht, was ich hauptsächlich suchte.

In des berühmten Herrn D. Schaarschmiedts Pathologie* traf ich weiter nichts, als unter den Ursachen der Zahnschmerzen, diese wenigen Worte an: bald entstehen sie von den Würmern, die sich in

*Th. II. Abschn. VI. Cap. II. Seit. 305.

in den Zähnen aufhalten. Der gelehrte Herr D. Krüger that mir auch kein Gnüge. Man will, heißt es in seiner Naturlehre *, auch endlich angemerket haben, daß die Zahnschmerzen bisweilen von sehr kleinen Würmern entstünden, welche sich in den hohlen Zähnen aufhielten. Ich habe keine Erfahrug davon. Ich kann aber auch nicht absehen, daß dieses unmöglich wäre. Da sich die Würmer in dem Magen und Gedärmen erhalten und fortpflanzen können, warum sollte dieses in den Zähnen nicht angehen. Es wird wahrscheinlich, wenn wir bedenken, wie viel kleine Würmer wir mit Speise und Trank in den Magen bringen, wie wir nur an den Käsemilben sehen können, deren Genus bey dem Käseessen unvermeidlich ist. Ich zog Herrn D. Kratzenstein zu Rathe **. Allein, auch dieser druckte sich nicht nur ganz kurz aus; sondern es war auch die Beschreibung und Abbildung seiner Zahnwürmer von der Art, daß ich sie auf die meinigen gar nicht anwenden konnte. Und so gieng es mir mit mehrern Schriftstellern. Jedoch an drey Orten traff ich eines und das andere an, welches sich näher zu meiner Absicht schikte. Ich will, was davon hieher gehöret, sogleich beyfügen, weil es demjenigen, was ich in dem folgenden beybringen werde, einige Erläuterung giebt.

Bey dem Velschius *** lieset man diese Anmerkung: Wir wollen den Gebrauch der unempfindlichmachenden Mittel (narcotica) nicht ganz verwerfen. Wir haben selbst gar öfters gesehen, wie von dem Rauche des Tollkrautes (hyosciamus), so mit Wachs vermischet worden war, die Würmer aus den hohlen und angefressenen Zähnen herausgesprungen seyn; welches auch ein Schrift-

* Th. III. Cap. XXXI. §. 284. Seit. 301. 302. ** Abhandlung von Würmern ꝛc. Seit. 5. Fig. 1. *** Vena medinensis sive de dracunculis veterum. cap. V. p. 138.

Schriftſteller, mit Namen Erotis, von Händen und Füſſen vorgiebt.

In den Engliſchen Abhandlungen* wird die Erzählung von gewiſſen Folgen, die aus dem Genuße des Tollkrautes (juſquiame) entſtanden, mit dieſer artigen Geſchichte beſchloſſen:

Bey Gelegenheit des Tollkrautes will ich ein Beyſpiel von den groſſen Tugenden der Körner dieſes Krautes für Zahnſchmerzen anführen. Vor einigen Jahren hatte eine Perſon vom Range unglaubliche Zahnſchmerzen. Man ſagte ihr von einem Quackſalber (Empirique); und da der gewaltige Schmerz ſie dahin brachte, daß ſie, um ſich geholfen zu ſehen, alles brauchte, was ihr nur gerathen wurde; ſo ließ ſie auch dieſen zu ſich rufen. Der Quackſalber warf Tollkrautskörner aufs Feuer, leitete den Rauch davon, vermittelſt einer kleinen Röhre, in die Hohlung des Zahnes, und der Schmerz hörte augenblicklich auf. Dieſer Charlatan ließ unter den Mund des Kranken ein Gefäß mit Waſſer halten, um damit, wie er ſagte, die Würmer aufzufangen, welche bey dem Gebrauche dieſes Mittels aus dem Zahne fallen würden. Als ich dieſe Geſchichte vernommen hatte, fand ich Gelegenheit, einen dieſer Würmer habhaft zu werden, wickelte ihn ſorgfältig in Seide ein, und ſendete ihn dem Herrn von Leeuwenhoek nach Delft in Holland. Dieſer Wurm kam lebendig und wohlbehalten an. Herr Leeuwenhoek unterſuchte ihn, und fand, daß er ganz eigentlich einer von denenjenigen ſey, die ſich im Käſe erzeugen, wenn er zu ſtinken anfängt. Er nahm dahero verſchiedene ſolcher Käſewürmer, und geſellte ſie demjenigen bey, den er von mir erhalten hatte; er nährete ſie von einerley Käſe; und alle dieſe Würmer verwandelten ſich nach dem unwandelbaren Geſetze

* Transactions philoſophiques de la Societé Royale de Londres. Anno 1733. p. 122.

Digitized by Google

ſetze der Natur zu kleinen Käfern. Herr Leeuwenhoek ſchikte mir dieſe Käfer insgeſamt, und ich habe nicht den geringſten Unterſchied an ihnen finden können. Es iſt dahero mehr als wahrſcheinlich, daß, ohnerachtet der Rauch von Tollkrautskörnern das Uebel mag vertrieben haben, der Charlatan dieſe Würmer muß mit ſich gebracht, und ſie ſchiklich ins Waſſer haben fallen laſſen. Und das iſt noch immer das künſtliche und berüchtigte Handwerk, vermöge deſſen ſich die Marktſchreyer und Quackſalber noch alle Tage einen Ruf durch ein Mittel erwerben, darüber man kaum den Mund aufthun würde, wenn es ein Arzneygelehrter, der ein ehrlicher und vernünfftiger Mann iſt, verſchreiben ſollte. In der Anmerkung zu dieſer Geſchichte heiſſet es: Das nämliche und faſt mit gleichen Umſtänden wird in Simon Paulli, unter dem Artickel des Tollkrautes; in dem Auszuge der Geſchichte der officinellen Kräuter des Hrn. Chomel Th. II. Seit. 778. der vierten Ausgabe; in der Pflanzengeſchichte des Hrn. Ray, Buch XV. Abſchn. I. Cap. I. Seit. 714. und an mehr andern Orten erzählet. Doch hindert dieſes nicht, daß man für dem Ritter Sloane nicht alle Verbindlichkeit haben ſollte, eine Erfindung bekannt gemacht zu haben, davon er Zeuge geweſen iſt, und die er ſo ſorgfältig unterſucht hat.

Endlich gehört noch hieher, deſſen der Pariſiſche Arzt, D. Andry, in ſeinem Unterrichte von Erzeugung der Würmer im menſchlichen Leibe gedenket *. Wider die Würmer in Zähnen, ſpricht er, rathen etliche Schriftſteller, man ſolle Bilſenkrautkörner verbrennen, und den Rauch an die Zähne gehen laſſen, und ſagen, man würde alsbald aus dem Munde Würmer herausgehen ſehen, welche dieſer Rauch mit ſich in die Luft

* Cap. IX. Seit. 193. der Leipziger Ausgabe 1716.

Digitized by Google

Luft zöge. Foreſtus. Lib. XV. Obſ. 7. ſagt: dieſe eingebildeten Würmer ſchienen nur Würmer zu ſeyn, denn dergleichen ſähe man ſtets mit dem Rauche vom Bilſenkraute in die Höhe gehen. Ich habe ſolches verſucht, aber nichts gefunden, das Würmern gleich ſiehet. Vermuthlich hat dieſes Foreſtus geſchrieben, ohne daß er eigene Erfahrung davon gehabt hat. Das wundert mich aber, daß ein anderer Schriftſteller ſchreibt, er habe es probiret, und wirklich dieſe Erſcheinung der Würmer geſehen. Das ſind ſeine Worte: „Es jucket einen oft an den „Händen, weil kleine Würmer und Milben, die ihren Unterhalt allda „finden, daran nagen. Damit ſie nun abfallen mögen, habe ich ge„ſehen, daß man Bilſenkraut, welches man deshalb auch Motten„kraut nennet, und kleine Körner hat, nimt, und auf folgende Art „ damit verfähret. Man hat ein Feuerpfängen mit Kohlen und ein „Becken mit Waſſer an der Hand. In die Kohlen ſchüttet man dieſe „Körner, und hält die Hände in den Rauch. Wenn man ſie lang „genug darinnen gehabt hat, dunket man ſie ins Waſſer, ſo wird man „augenblickes unſäglich viel Würmer auf dem Waſſer ſchwimmen ſe„hen; und ſagt man beſtändig, daß dieſes die Würmer wären, die „aus der zarten Haut hervorgekrochen gekommen. Als ich dieſe Wir„kung mit angeſehen, und betrachtete hernach die Hände, an denen „nicht ſchiene, daß ſich dergleichen zugetragen hätte, wollte ich gerne „hinter den Betrug kommen. Derhalben hielt ich ein Stückgen Holz „in den Rauch von Bilſenkörnern, und löſchte es hernach im Waſſer „ab, und es kamen darauf eben dieſe Würmer zum Vorſcheine. Der„gleichen thät ich mit einem Pantofel, mit einem Stück Eiſen und an„dern Sachen mehr, und der Erfolg war einerley. Ich hielt auch „meine Hand darüber, an der mich nichts jukte, und wurde gewahr, „daß eben ſo viel Würmer zu ſehen waren, als diejenigen ſollten von „ſich gegeben haben, die mit großem Jucken beladen waren. Des„halben konnte ich dieſes vor nichts anders als einen Betrug halten,

„und daraus schließen, daß, wenn diese Körner im Rauche aufgehen, „ihr dicker Saft hernach im kalten Wasser wiederum sich zusammen „begebe, und gleichsam Würmer vorstelle.„ Ich habe diese Probe gemacht, es hat mir aber keines wollen angehen, ich mogte auch in den Rauch halten, was ich wollte, und ins Wasser tauchen, so wollte sich doch nichts blicken lassen, das aussahe, wie ein Wurm. Ich habe es mit den Händen einer Person versucht, die die Krätze hatte, und es gieng auch nicht an. Da siehet man, was vor Fabeln bey den Schriftstellern anzutreffen sind. So viel aus gedachten Schriften.

Ob ich nun gleich, auch in erstgedachten Schriftstellern, dasjenige eigentlich nicht antraff, was ich gerne wissen wollte, und welches mich der Mühe hätte überheben können, mit meinen dermaligen Zahnwürmern selbsteigene Versuche anzustellen; so dieneten mir doch ihre Erzählungen und Anmerkungen zu einem Zeugnisse, daß es von längst her eine gemeine Sage, und nicht seltenes Vorgeben sey, daß es Zahnwürmer gebe; ja daß es, nach Herrn Krügers Redensart, an sich auch gar nicht unwahrscheinlich sey, sondern nur noch an hinreichenden Erfahrungen fehle. Ich wurde also dadurch um so mehr angereitzet, die Hand selbst anzulegen, in der einsweiligen Hoffnung, daß mir diese Erfahrung, Entdeckung und Entwickelung vieleicht mögte aufbehalten seyn. Und ich konnte dieses um so getroster thun, indem so viel von verschiedenen Gelehrten vorlängst erwiesen worden ist, daß der Schleim, welcher bey dem Essen an den Zähnen hängen bleibet, voller Insekten und kleiner Würmer stecke; und davon ein Jeder, der solchen Schleim mit etwas Wasser dünne macht, und unter die Vergrößerung bringet, selbst und am geschwindesten ein Augenzeuge werden kann.

Ich nahm also diese Zahnwürmer aus dem Wasser, und legte einige förderſamst dem Mahler vor, um sie sogleich nach der Natur

und

und auch nach der Vergrößerung abzuzeichnen; die andern nahm ich zur Unterſuchung, und betrachtete ſie vor allen Dingen mit den bloſen Augen. Und wie ſonderbar!

Ich mogte dieſe Körper anſehen, wie ich wollte, ſo wurde der Gedanke, daß es wahre Würmer ſeyn mögten, immer glaubwürdiger und lebhafter in mir. Sie hatten alle einerley Hauptgeſtalt und Bildung *, nur daß einige mehr und weniger gekrümmt; einige ganz weiß, andere etwas braungelb; einige größer, andere kleiner; einige einfach geſchwänzet, andere doppeltſchwänzig waren. Ich fand an ihnen alle weſentliche Merkmaale und Unterſcheidungsſtücke eines Wurms. Sie hatten einen etwas dicken Kopf, der vorn in eine ſtumpfe Spitze auslief, und welche der Mund zu ſeyn ſchien. Der Leib war nach Maaßgabe des Kopfes ziemlich lang, rundlich, und mir dünkte ringelartige Einſchnitte, als die weſentlichen und eigentlichen Kennzeichen eines Wurms oder Inſektes, an demſelben zu bemerken. Sie hatten auch einen Schwanz, der zwar an vielen nur einfach war, und ſtumpf auslief, der aber, als das Artigſte, an den allermeiſten doppelt geſehen wurde, und zwar ſo, daß jeder nach außen zu gewölbt, nach innen zu aber plattgedruckt war. Ihre Farbe war, wie ſchon gedacht, bey den meiſten ſchön weiß, nur daß an dem Kopfe um die Gegend des anſcheinenden Mundes, und unten am Ende des einfachen oder doppelten Schwanzes, ein braunes Fleckgen ſichtbar war; und daß auch einige ganz und gar ins braune oder gelbliche fielen. Ich zerdrukte einige mit einer Stecknadel, und da glaubte ich ganz eigentlich zu ſehen, wie die Eingeweide und die innern Theile dieſer Würmer durch den zerplazten Balg ſich heraus begaben. Ja, ich konnte mit gar leichter Mühe die äußere Haut von den übrigen Theilen des Wurms abſchälen und abſondern. Da ich einen ausgeſchälten Wurm näher betrachtete, ſo

* Fig. I.

dünkte mich an ihm Theile von verschiedener Art, und wie eine Gattung von Gedärmen zu beobachten.

Um aber alles noch deutlicher auseinander zu setzen und bestimmen zu können, brachte ich etliche zu verschiedenenmalen unter die Vergrößerung*. Allhier fand ich die äußerliche Haut des Wurms ohne merkliche Einschnitte und Absätze, statt derselben aber solche mit lauter vertieften Punkten überstreuet **, oder vielmehr als ein sonderbares Gewebe von lauter erstgedachten Vertiefungen. Wenn ich diese äußere Haut abschälete, zerschnitte und einzelne Stücke betrachtete, so schien sie da, wo die vertieften Punkte waren, ziemlich durchsichtig zu seyn. Der obere Theil des Wurms hatte eine ordentliche Kopfsgestalt ***, und die vordere stumpfe Spitze stellte itzo noch mehr, als dem bloßen Auge, einen ordentlichen Schnabelförmigen Mund oder Saugrüssel vor †. Das braune Fleckgen an demselben schien eine Art von Oeffnung zu seyn; ob ich sie gleich so eigentlich nicht zu Gesichte bringen konnte, vielleicht, weil sie gar zu klein war, oder weil es die dunkelbraune Farbe verhinderte. Von Augen konnte ich zwar nichts ausfindig machen; allein ich dachte, daß es auch Würmer geben könne, an denen die Augen, wie an gewissen Polypenarten, so leicht nicht zu bemerken wären. An dem Leibe †† und an dem einfachen oder doppelten Schwanze ††† sahe ich weiter nichts Besonders, was nicht schon angeführet worden ist; außer, daß da, wo der doppelte Schwanz ansaß, in der Mitte eine Oeffnung und der After zu seyn mir vorkam. ‡ Weil aber die einfach geschwänzten um diese Gegend keine Oeffnung hatten, so kam mir auch nicht ganz unglaublich vor, daß der braune Punkt, in welchem sich jeder einfache und doppelte Schwanz endigte ‡‡, eine Oeffnung oder dergleichen etwas haben könnte. Und ich muß überhaupt gestehen, daß der

* Fig. IV. V. VI. IX. X. XI. ** Fig. VI. a. a. *** Fig. IX. X. XI. a. † b. †† c. ††† Fig. IX. X. XI. e. e. ‡ Fig. IX. X. d. d. ‡‡ Fig. IX. X. XI. f. f.

Digitized by Google

der doppelte Schwanz das einzige war, was mir an diesen Würmern ganz außerordentlich, und als so etwas vorkam, daß ich auf diese Art bey keinem Insekte noch gefunden hatte, auch sonst bey keinem Schriftsteller, so viel mir erinnerlich, angemerket wird. Füße konnte ich auch unter der Vergrößerung nicht ansichtig werden; allein diese mangeln ebenfalls vielen andern Würmern.

Was die innerlichen Theile dieser Würmer anlanget, so zeigten sie sich unter der Vergrößerung ganz besonders. Es waren lauter weiße, helle und durchsichtige Kügelgen *, die in einer gar schönen Reihe und Ordnung Linienweise neben und hintereinander fortliefen. Sie kamen den Polypenkörnergen oder Knöttgen, aus welchen die Polypen gebauet seyn, und deren ich in eigenen Abhandlungen ausführlicher gedacht habe, vollkommen gleich; und ich konnte eben keine Ursache finden, warum nicht auch diese Würmer, ohne sonst Eingeweide oder andere Gefäße zu haben, aus lauter Polypenähnlichen Kügelgen oder Knöttgen bestehen sollten. Nur dadurch unterscheideten sich die gegenwärtigen an den Würmern, daß sie weit ordentlicher und in deutlichen Linien nebeneinander stunden, da sie hingegen bey den Polypen mehr unordentlich durcheinander bemerket werden; und daß sie auch hier viel fester aneinander geleimet, und gleichsam durch lange und zarte Zwischengefäßgen, wie durch Zäsergen, zusammengeheftet waren.

Dieß war der innere und äußere Bau dieser so berüchtigten Zahnwürmer. Konnte ich wohl hiebey noch Anstand nehmen, sie vor wirkliche Würmer zu halten? Hatten sie nicht mit andern Würmern die größte Aehnlichkeit? Fand sich nicht alles an ihnen, was man sonst an Würmern beobachtet? Gewis, es gieng ihnen nichts, als nur noch das Leben ab. Und ob ich mir gleich eben nicht versprechen konnte, sie, aus leicht zu begreiffenden Ursachen, jemalen in lebendiger Gestalt habhaft zu werden; so schien mir doch die Art, wie sie sich auch so gar todt

* Fig. IV. V. VI. b.

todt darstellten, die Muthmaßung mehr, als zu sehr, zu bestärken, daß sie vorher müßten gelebt haben. Ihre krumme und zusammengezogene Bildung kam mit vielen Arten todter Würmer, sonderlich der Schlangenwürmer und derer, aus welchen geflügelte Insekten entstehen, vollkommen überein, als welche bekanntermaßen im Tode insgemein eine gekrümmte und halbmondförmige Gestalt annehmen. Ja da einige mehr und weniger gekrümmet, und viele auch völlig gerad ausgestrekt, vorgefunden wurden, so war es wohl um so scheinbarer, daß sie im Leben mit dem Vermögen willkührlicher, das ist, lebendigen Thieren eigenen und mannigfaltig veränderlichen Bewegungen müßten versehen gewesen seyn. Ich machte mir zwar hiebey noch verschiedene andere Einwürfe; allein es wurde mir nicht schwer, sie nach demjenigen auch selbst wieder aufzulösen, was mir sonst von Würmern bekannt ist.

Ich will es nur offenherzig gestehen, bis hieher glaubte ich selbst nichts anders, als Würmer, vor mir gehabt und behandelt zu haben. Ich fand bey nahe schon zum voraus ein rechtes Vergnügen in mir, auf diese Weise zur Entdeckung eines neuen Wurmgeschlechtes gekommen zu seyn. Eine Entdeckung, welche man noch dazu nunmehro zum Nutzen der Menschen weit glücklicher würde anwenden können, als da man diese Zahnwürmer bishero nur wahrscheinlich geglaubet, und, als nicht ganz unmögliche Ursachen der Zahnschmerzen, dunkel angegeben hatte.

Um aber nichts unausgemacht zu lassen, was zur Bestättigung dieses neuen Wurmgeschlechtes dienen mögte, so stellte ich darüber noch anderweitige Betrachtungen an. Ich glaubte, daß hierbey sonderlich noch zweyerley zu untersuchen und auszumachen wäre. Einmal, ob diese Würmer nicht etwan zufälliger Weise von außen her, und unter den Zubereitungen, mögten herbey gebracht worden seyn, oder wenigstens in dem Wachse und Judenkirschen gestecket haben? Und

zwey-

zweyrens, ob denn auch allezeit bey jedem Gebrauche des oftgedachten Mittels wider das Zahnwehe diese Würmer abgetrieben würden, und zum Vorscheine kämen. Ich stellte mir vor, daß, wenn bey allen Versuchen die vorigen und einerley Erscheinungen erfolgten, man sicher werde schließen dürfen, daß hiebey nicht, wie bey der obigen Geschichte des Herrn Ritters Sloane, Betrug noch Blendwerk Platz greiffen; sondern daß es mit diesen Zahnwürmern und dem Hülfsmittel seine gute Richtigkeit haben werde. Ich machte mit dem zweyten bedingten Satze die Probe zuerst.

Ich ließ mir vor allem den nämlichen Topf und die nämlichen Werkzeuge ausbitten, deren sich die Standsperson bey ihrer Cur bedienet hatte. Nun kann ich zwar nicht leugnen, daß mir gleich bey dem Anblicke dieses Topfes und der Werkzeuge manche Bedenklichkeit in die Gedanken kam, die mir vorher nicht beygefallen war. Allein ich unterdrükte mit Fleiß dermalen noch allen Anstoß, um regelmäßig zu verfahren, und durch nichts irre zu werden. Ich gieng unbedenklich weiter, und erkundigte mich nach einigen Personen, die mit Zahnschmerzen geplaget waren. Ich bereitete mit eigener Hand verschiedene der oben beschriebenen Kügelgen aus Wachse und Judenkirschen, und übersandte nebst dem Topfe und den Werkzeugen solche den leidenden Personen, mit der Bitte, sich gehörig damit zu räuchern, und den Erfolg davon mir unpartheyisch wissen zu lassen.

Man that mir diese Gefälligkeit; und es mußte mir die größte Verwunderung verursachen, da mir von einer jeden dieser verschiedenen Personen die nämliche Art von Würmern, so man nach dem Gebrauche des Mittels im Wasser gefunden hatte, überbracht wurde. Jedoch, so übereinstimmig in diesem Stücke die Aussage aller dieser Personen war, so verschieden lautete sie in Ansehung der dadurch erlangten Hülfe. Einige waren des Zahnschmerzens unmittelbar darauf looß geworden; einige hatten darauf gar keine Linderung verspühret; und noch

andere versicherten, daß es gar noch ärger und der Schmerz weit heftiger geworden wäre. Dieser so ungleich lautende Anhang war mir freylich so gar angenehm nicht; indessen waren doch bey allen Würmer, und zwar einerley Art Würmer, abgetrieben worden. Wer weis, dachte ich, ob nicht etwan diejenigen Personen, welche den guten Erfolg nicht so, wie die andern, empfunden haben, beym Gebrauche dieses Mittels etwas übersehen, und dasselbe nicht sorgfältig und lang genug mögen gebraucht haben? Ich achtete es daherv am rathsamsten bey ersterer Gelegenheit in meiner Gegenwart selbst die Probe machen zu lassen. Es fand sich auch gar bald eine Person, wo ich den Versuch machen konnte. Ich ließ dieselbe auf mein Zimmer kommen; ich bereitete alles nöthige selbst dazu her, und ließ das, was dabey zu veranstalten und zu verrichten war, ganz allein durch meine Hände gehen. Nachdem die Cur vorbey, vermeynte die kranke Person, daß der Schmerz zwar etwas geringer, jedoch um gar viel es nicht besser sey. Da ich aber den Topf in die Höhe hob, waren, wie allezeit, Würmer im Wasser.

Nach solchen so vielfachen Versuchen konnte ich nun so viel gewis und mit Zuverläßigkeit schließen, daß bey dem Gebrauche dieses Mittels, wenn damit auf die beschriebene Weise verfahren würde, sich allzeit, obgleich bald mehrere, bald wenigere der gemeldten Würmer vorfänden. Es war also nur dieses noch zu entwickeln, ob nicht etwan diese Würmer zufälliger Weise mögten von außen dazu gekommen, oder allererst von denjenigen Dingen entstanden seyn, deren man sich bey diesem Hülfsmittel zu bedienen habe. Allein ich konnte durch nichts auf die geringste Spur von etwas dergleichen kommen.

Diese Würmer waren durchgehends und in allen Stücken einander gar zu ähnlich, welches bey so verschiedenen Versu-

chen

ſuchen von blos zufälligen und fremden Urſachen unmöglich würde erfolget ſeyn. Von dem Topfe, von dem Eiſen, von der Schüſſel und dem Waſſer ließ ſich auch nichts dergleichen vermuthen. Dieſe waren, wenigſtens da bey mir der Verſuch gemacht worden, von mir vorhero ſo genau beſichtiget und gereiniget worden, daß kaum ein Stäubgen, geſchweige dann dergleichen ſichtbare Würmer oder Körper hätten irgendwo hangen und verborgen bleiben können. Ich unterſuchte das Wachs, davon ich gebrauchet hatte, und ich konnte auch an demſelben nicht das Mindeſte, auch nur von weitem, gewahr werden, das dieſen Würmern ähnlich geweſen wäre. Ich nahm die Judenkirſchen in Unterſuchung. Ich beſahe und zerlegte die Schaale; ich beleuchtete das dürre Mark und Fleiſch derſelben; ich betrachtete den Niernförmigen Saamen. Aber weder an der einen, noch an den andern, fand ich das allergeringſte Merkmaal von dem, wie dieſe Würmer gebildet und gebauet waren; von dem Saamen konnte man um ſo weniger dergleichen Würmer vermuthen, da jeder bey nahe doppelt ſo lang war, als ein Saamenkorn.

Eines fiel mir noch bey. Vieleicht, dachte ich, mögen dergleichen Wurmähnlichen Körper entſtehen, wenn Wachs und Judenkirſchen, jedes vor ſich allein, oder beyde miteinander vermenget, durch das Feuer gehen und davon verändert werden. Ich prüfte auch dieſes; und nahm daher zuerſt Wachs allein, legte es auf das glühende Eiſen, und hielt es über eine Schüſſel mit Waſſer. Allein, es wollten ſich aus dem ſchmelzenden und herabfließenden Wachſe keine Würmer erzeugen, ich mogte es auch noch ſo oft verſuchen. Ich wendete mich zu den Judenkirſchen. Allein, hier kam vollends nichts heraus. Kaum daß ich ſie auf das glühende Eiſen geleget hatte, ſo gaben ſie zwar einen ſtark ſtinkenden Rauch von ſich, es verbrannte aber auch alles augenblicklich zu einer ſchwarzen Aſche, und von Würmern war nicht das Geringſte zu ſehen. Ich nahm endlich Wachs und Judenkirſchen,

untereinander gemiſcht, und legte einige daraus verfertigte Kügelgen auf das glühende Eiſen. Allein, auch dieſes war vergebens. Es wollten auch hier keine Würmer ſichtbar werden; man hörete nur einiges Knattern, und ſahe, unter dem Verbrennen das zerſchmelzende Wachs hin und wieder ſprützen, oder etwas aus demſelben wegſpringen.

Und nun wußte ich in Wahrheit ſelbſt nicht mehr, was weiter zu unterſuchen und vorzunehmen ſeyn mögte, um das Wahre und Eigentliche bey dieſem Gegenſtande zu entdecken. Ich konnte hoffen, auf meiner Seite hierbey alles Mögliche gethan zu haben, um, wo immer möglich, dahinter zu kommen, ob dieſe Körper wahre Würmer wären, und ob ſie von etwas andern, als aus den Zähnen, ihren Urſprung hätten oder nicht? Da nun alles angezeigtermaßen für das Erſtere ausgefallen war; was konnte ich dann noch vor ein Bedencken und Anſtand nehmen, der Meynung beyzupflichten: daß dieſe Zahnwürmer ein beſonders Wurmgeſchlecht wären, und daß das angerühmte Mittel ſie tödte und abtreibe.

Meine Leſer dürfen zwar nicht glauben, als ob unter den erſtgedachten Verſuchen nicht gleich vom Anfange hier und da manches Zweifelhafte und Bedenkliche mit untergelauffen ſey. Nein, ich habe ſchon eines ſolchen Umſtandes oben, als im Vorbeygehen, erwähnet, und ich werde in dem folgenden Abſchnitte noch mehr davon anführen, wie ich nach und nach, und ſtufenweiſe auf den rechten Weg gekommen bin. Dermalen habe ich ſolches noch mit Fleiß zu übergehen vor gut gefunden. Wollte man ſich indeſſen noch einmal die Mühe geben, und alles, was bisher von mir angeführet worden iſt, in kurze Sätze bringen; ſo würde gewis nichts wahrſcheinlichers ſeyn, wo nicht gar, als ganz augenſcheinlich gewis und zuverläßig können behauptet werden, als daß es mit dieſen Zahnwürmern und dem Mittel wider ſie ſeine ausgemachte Richtigkeit habe.

Sollte

Sollte noch etwas abgehen, so mögte es dieſes ſeyn, dieſe neue Wurmart auch in ihre Ordnung, Claſſe und Geſchlecht anzuweiſen. Vieleicht würden ſie einige vor eine Gattung Milben halten. Vieleicht mögte ſie ein anderer unter die Schlangenwürmer rechnen. Und wer weis, ob nicht diejenigen, die in unſern Tagen alles zu Polypen machen, und mit Polypenaugen anſehen, die gröſte Urſache finden mögten, auch dieſe Würmer vor eine neue Polypenart zu erklären. Ihr inneres gekörntes Gebäude, und ihr doppelter Schwanz könnte ſie wenigſtens nicht ohne alle Wahrſcheinlichkeit auf dieſe Gedanken bringen.

Und auf dieſe Weiſe genüget mir, in dieſem Abſchnitte ausgeführet zu haben, wie mehr als Eines allerdings zu beſtättigen ſcheinet, was man von dieſen Zahnwürmern und dem Mittel dagegen zu erzählen pfleget.

Dritter Abſchnitt.

Andere mit den vermeyntlichen Zahnwürmern gemachte Verſuche, in ſo fern ſie die offenbarſten Zeugniſſe ſind, daß es mit dieſen Würmern, und alſo auch mit dem dagegen angerühmten Hülfsmittel lauter Irrthum, Vorurtheil und Blendwerk ſey.

Ich habe in der vorhergehenden Abtheilung mit einer Menge der wahrſcheinlichſten Gründe dargethan, daß die mehrgedachten Zahnwürmer nichts anders als wahre und eigentliche Würmer ſeyn könnten; und wie es keine Einbildung, ſondern Wahrheit ſey, daß das vorgeſchlagene Hülfsmittel die berührte Wirkung habe. Nunmehro werde ich alles gerad umkehren, alle dieſe Gründe ſelbſt

durch Gegengründe bestreiten, und erstere in ihrer ganzen Schwäche und ihrem offenbaren Ungrunde aufstellen. Ich schmeichle mir auch zum voraus, daß ich Jedem meiner Leser vom Letztern überzeugen werde.

Zuerst will ich diejenigen Umstände anführen, die mir von verschiedenen Seiten her diese Würmer und das Hülfsmittel dagegen gleich Anfangs, und nachher allmählig immer mehr, zweifelhaft gemacht haben. Hernach werde ich durch lauter Sinnlichkeiten die völlige Unmöglichkeit und die offenbare Betrüglichkeit erweisen. Und damit alles erschöpfet werde, will ich drittens den wahren Ursprung dieser Würmer, woher sie kommen, und was sie eigentlich sind, auch dabey die Ursachen beybringen, warum jenes Hülfsmittel, ohne daß es Zahn-Würmer gebe, und diese dadurch getödtet werden, gleichwohl in Zahnschmerzen seinen guten Nutzen schaffen könne, und in gewissen Fällen wirklich habe.

So lang ich die bey der obgedachten Cur gebrauchten Werkzeuge nicht gesehen hatte, so lang war mir eben nach dem bloßen Augenscheine wider die vor mir gehabten Würmer kein besonderer Zweifel aufgestiegen. So bald ich aber diese Werkzeuge zu Gesichte bekommen hatte, so wurde auch so gleich mancher bey mir rege. Ich fand alsobald die eine Hauptöffnung im Boden so klein gemacht, daß ich mir nicht vorstellen konnte, wie die in den Zähnen sich befindenden Würmer, entweder für sich, oder mit dem Speichel, und zwar ganz allein durch diese Oeffnung hindurch, und ins Wasser hinab fallen sollten, ohne, daß oben auf den Boden selbst einer und der andere je zu liegen käme; welches jedoch ausdrücklich von allen, die den Versuch gemacht hatten, verneinet wurde. Ich konnte mir ferner davon keinen Begriff machen, wie, wenn sich in einem hohlen Zahne des untern Kinnbackens, als welches der oben erzählte Fall war, Würmer befän-

fänden, dieſe ihren Weg erſt aus dem Zahne ganz gerad oder ſchräg in die Höhe, und hierauf in einer geraden Linie nehmen, endlich aber alle bis vor die kleine Oeffnung gebracht, und dadurch ſämmtlich hinab fallen ſollten? Dieſes ſchien mir alsdenn um ſo unfaßlicher zu ſeyn, wenn der leidende Zahn einer von den zween letzten Backzähnen ſeyn ſollte, indem ſich, wegen der Backen, der Lippen, und der Lage dieſer Zähne noch mehrere Schwürigkeiten finden würden, lebendigen oder todten Würmern einen ſolchen Ausgang und Weg einzugeſtehen.

Mein Verdacht wurde bey weiterm Nachdenken immer ſtärker. Selbſt die Anzahl der Würmer, die ſich bey jeder einzeln gemachten Probe vorgefunden hatten, trug das Ihre nicht wenig bey. Man hatte derſelben oft zwanzig und dreyßig gezählet. Wie konnte doch dieſe Menge in einem einzeln hohlen Zahne, wenn man ſich auch die Höhle deſſelben noch ſo groß vorſtellen wollte, Platz und Raum gehabt haben? Ja, da bey einigen Perſonen, wie oben erinnert worden iſt, dieſe Anzahl noch nicht einmal Linderung geſchaffet hatte, ſo war muthmaßlich, daß noch mehrere müßten zurück geblieben ſeyn. Kann aber wohl ein einziger Zahn zu einem ſolchen erſtaunlichen Wurm-Neſte geräumig genug ſich vorgeſtellet werden? Zumal, da dieſe Menge von Würmern im Leben auch noch Raum gehabt haben mußten, um ſich bewegen zu können, und eben dadurch den Schmerz zu verurſachen. Dieſes war mir im höchſten Grade unwahrſcheinlich, und vollkommen unglaublich.

Als ich obgemeldtermaßen mit einer Perſon auf meiner Stube die Probe machte, ſo ließ ich das erſtemal den Topf bey Seite, und fieng, wie ich es ſonſt geſehen und geleſen hatte, den Rauch mit einem Trichter auf. Allein, es wollten auf dieſe Weiſe keine Würmer zum Vorſcheine kommen, ob ich es gleich einigemal hintereinander verſuchte. Ich nahm hierauf den Topf wieder zu Hülfe; und da waren auch alſobald die Würmer, wie je und allezeit, zugegen. Dieſer ſeltſame Erfolg

folg machte mir mehr als alles bisherige Argwohn! Und da gedachte Person, wie gemeldet worden ist, nach dem Gebrauche dieses Mittels gleichwohl keine völlige Hülfe verspührte, so nahm ich den Versuch noch einmal, ohne den Topf, vor. Nun wollten zwar auch dießmal keine Würmer in das untergestellte Wasser fallen. Als ich aber auf dem Tische, den ich vor diesem Versuche nochmals sorgfältig abgekehret und abgewischet hatte, nachsahe, fand ich ganz weit von der Schüssel einen dieser Würmer liegen. Dieser Zufall machte mir folgends die Sache verdächtig, und brachte mich von da an zu solchen Gedanken und Veranstaltungen, vermöge welcher ich endlich überzeuget wurde, daß diese ganze Geschichte wirklich ein eitles Vorurtheil sey.

Vieleicht, dachte ich, hat es mit diesen Zahnwürmern eben die Beschaffenheit, wie mit jener Fabel vom güldenen Zahne eines schlesischen Knabens. Nachdem sich die Herren Gelehrten, wegen der natürlichen Möglichkeit eines solchen güldenen Zahnes lang genug herumgetrieben, und einer dem andern über seine Meynung verketzert hatten, so verwandelte sich endlich der ganze Streit in ein leeres Nichts. Denn es fand sich am Ende, daß der Zahn nie vom Golde gewesen war. * Wer weis, urtheilte ich, ob am Ende hier nicht eben dergleichen

* Da Hr. D. Krüger diese Geschichte in seiner Naturlehre. Theil II. Cap. IV. §. 47. Seit. 89. nach seiner lebhaften Schreibart auf eine Weise anführet, die mit dem Zwecke meiner Abhandlung viel Gleichheit hat; so trage ich kein Bedenken, sie hier beyzusetzen. Die Geschichte, spricht er, ist so lustig, und zeigt die Schwäche dererjenigen, welche die schwersten Sachen ganz leicht begreifen, so deutlich, daß ich mich nicht enthalten kan, sie zu erzählen. Im Jahr 1593. entstund das Gerüchte, daß einem Kinde in Schlesien, den im 5ten Jahre die Zähne ausgefallen waren, an statt des Backzahnes ein neuer, guldener Zahn gewachsen wäre. Dieses war eine Gelegenheit, da die Gelehrten ihre Kunst in Untersuchung natürlicher Begebenheiten beweisen konnten. Daher konnte es nicht fehlen, es mußte Horst, ein Professer der Arzneykunst zu Helmstädt, im Jahr 1595. eine Historie von diesem Zah-

chen etwas heraus kommen wird. Muthmaßungen hatte ich aus dem Angeführten genug dazu, und es kam nun auf weiter nichts, als auf den Erfolg desjenigen Versuches an, der es klar machen sollte. Ich glaubte an mir selbst die beste und sicherste Probe machen zu können. Zwar bin ich GOtt Lob! den Zahnschmerzen nicht unterworfen. Allein, eben auf diese Weise vermuthete ich am ersten erfahren zu können, ob diese Würmer ihren Ursprung aus Zähnen hätten, oder nicht?

Ich machte solchemnach den Versuch zuerst ohne den Topf. Allein, auf die Art gab es, wie es auch oben geschahe, keine Würmer. Ich bediente mich daher zum andernmale des Topfes; und hier sahe ich wieder die Menge Würmer im Wasser liegen. Da ich nun vorher keine Zahnschmerzen gehabt hatte; so konnte ich nimmermehr glauben, daß diese Würmer sollten in meinen Zähnen sich aufgehalten, ohne

 sie,

Zahne schreiben, darinnen er behauptete, daß es theils natürlich, theils übernatürlich zugehe; Ja GOtt habe ihn deswegen wachsen lassen, damit die Christen, die von den Türken gedränget würden, dadurch getröstet werden mögten. Freylich war es wohl ein grosser Trost vor die Christen, daß ein Kind einen güldenen Zahn hatte, und man kan leicht denken, was unter den Türken und einem güldenen Zahne vor ein Zusammenhang sey. Horst sollte die Ehre von einer so wichtigen Materie geschrieben zu haben nicht allein besitzen. Daher schrieb Kuland noch in demselben Jahre eine neue Historie von diesem Zahne. Nun hat es von allen Zeiten her Leute gegeben, deren Art es mit sich bringet, andern zu widersprechen. Darum schrieb Ingolstäter wider die Meynung, die Kuland von diesem Zahne behauptet hatte; und Kuland that sehr wohl, daß er sogleich eine schöne und gelehrte Antwort darauf verfertigte. Endlich suchte Libau alles das zusammen, was von diesem Zahne schon geschrieben worden war, und setzte noch seine eigene Gedanken hinzu. Dieses war alles vortreflich, aber das war schlimm, daß der Knabe niemals einen güldenen Zahn gehabt hatte. Denn als ein Goldschmied denselben untersuchte: so fand er, daß man ein Goldblättgen mit vieler Geschicklichkeit über den Zahn geklebet hatte.

ſie, und von ihnen Schmerzen, empfunden zu haben. Um aber der ganzen Wurmgeſchichte den letzten Stoß zu geben, ſo machte ich den letzten Verſuch mit ihnen, und zwar ſo, daß, nachdem ich alles gewöhnlicher Weiſe zugerichtet, den Topf ins Waſſer geſetzet, und die Kügelgen auf das glühende Eiſen innerhalb den Topf gebracht hatte, ich mich mit dem Munde ſo wenig dem aufſteigenden Rauche näherte, daß ich mich vielmehr augenblicklich zurück begab, und den Rauch ungehindert in die Luft empor ſteigen ließ. Und wie wunderbar! Auch itzo waren dieſe berüchtigte Zahnwürmer, wie vorher, in Menge vorhanden. Beweis genug von dem Betruge und der Unmöglichkeit, daß dieſe Würmer in den Zähnen wohnen, und durch den Rauch von Judenkirſchen getödtet und abgetrieben werden ſollen!

Man mache mir hier nicht den Einwurf, warum ich nicht gleich das erſtemal ſo, wie zuletzt, verfahren ſey? Denn eben dieſes dienet zu einem Zeugniſſe, wie leicht eine Sache oft zu entdecken wäre, wenn uns jedesmal ſogleich der rechte Gedanke beyfiel, und wenn man nicht durch Vorurtheile, und dadurch, daß man etwas ſchon vor bekannt und richtig annimt, in der Irre geführet, und durch ſcheinbare Gründe ſehr lang herum getrieben würde. Nebſt dem kann ich auch gar nicht in Abrede ſeyn, daß mir dieſer letzte Verſuch manchmal in die Gedanken kam; ich wollte ihn aber meinem dermaligen Zwecke gemäß mit Fleiß zu letzt verſpahren.

Dieß aber mögte man mir entgegen ſtellen, wie zwar zureichend ins Licht geſetzet und erwieſen worden ſeye, daß man dieſe vorgeblichen Würmer für keine wahren halten könne. Allein, es frage ſich eben daher: Was es denn ſonſt vor Körper ſeyn mögen; wie es zugehe, daß ſie nur auf die gemeldte Art zum Vorſcheine kommen; und was die Urſache ſeyn müſſe, daß der Gebrauch des vorgeſchlagenen Hülfsmittels gleichwohl die Zahnſchmerzen, wo nicht

alle-

allezeit, doch meistentheils zu stillen pflege? Ich hoffe im Stande zu seyn, diese drey nicht uneben vorgebrachte Fragen, und zwar ganz sinnlich, auflösen zu können.

Was die erste Frage betrift; so sucht man freylich, wie ich oben schon gedacht habe, diese anscheinenden Würmer in entfernten äußerlichen Ursachen, in den bey diesem Hülfsmittel gebrauchten Werkzeugen, im Wachse, und in Judenkirschen, dessen Schaale und Fleische, ganz vergebens. Sollen sie aber ja wo stecken, so mögte der Nierenförmige Saame noch am wahrscheinlichsten eine Vermuthung dazu geben. Vielleicht sind sie der in jedem Saamenkorne verborgen liegende Keim der Pflanze?

Ich gestehe es, diese Muthmaßung gieng mir nicht so bald bey, als sie mir zugleich auch sehr wahrscheinlich vorkam. Nur stund ich darinn an, daß eines theils jeder anscheinende Wurm viel zu groß war, als daß er in diesem Saamenkörngen sollte Platz haben können; und daß andern theils ich mir gar nicht vorstellen konnte, wie dieser Keim auf die erzählte Weise und vermöge der gemeldten Behandlung auf einmal sichtbar werden, und sich auf eine so besondere Art aus seinem Gehäuse oder seiner Hülse entwickeln sollte? Jedoch, da mir wahrscheinlich vorkam, daß, im Falle letztere Meynung Grund haben sollte, solches wohl ohnläugbar der Hitze des glühenden Eisen, und dem dadurch zerschmelzten Wachse zu zuschreiben seyn mögte; so glaubte ich solches dadurch am ehesten und gewissesten erfahren zu können, wenn ich eine Menge dieser Saamenkörner von Judenkirschen im siedenden Wasser aufquellen und kochen würde. Ich versuchte es, und fand, daß ich nicht uneben geurtheilet hatte. Denn aus den meisten dieser Saamenkörner hatte sich unter dem Kochen und Aufsieden der Keim so stark heraus begeben, daß er der Hülse nur noch gar wenig ansaß*.

* Fig. II. b. c. Fig. VII. a.a. b.

Ich besahe verschiedene dieser Keime auf das genaueste, und sie waren den vermeyntlichen Zahnwürmern vollkommentlich gleich. Ich zerdrukte sie; ich zergliederte sie; ich brachte sie unter die Vergrößerung, und kein Ey kann dem andern so gleich kommen, als diese Keime den mehrgedachten Würmern. Bey diesen eräugten sich, wie bey jenen, einerley Erscheinungen und Beobachtungen. Und da ich einige dieser Körner ablöfete, und sie mit einer Stecknadel etwas behandelte, so wurde jeder auch doppelschwänzig. Um aber zu sehen, was der Keim in dem Saamenkorne vor eine natürliche Lage habe; so quellte ich eine Menge derselben einige Tage lang im Wasser auf. Als ich sie nachmals zergliederte, fand ich, daß jeder Saame drey wesentliche Theile habe, nämlich, eine äußere Schaale, ein inneres Mark oder Fleisch, und einen in einer hohlen Rundung liegenden Keim. Und hieraus erhellet zur Gnüge, was diese anscheinende Zahnwürmer nach der Wahrheit sind. Sie sind nichts weniger als Würmer, oder Geschöpfe, so etwan zum Thierreiche gehören; sie sind aus dem Pflanzenreiche, der Keim von den Saamenkörnern der Judenkirschen.

Auf die zweyte Frage, wie dieser Keim auf die bestimte Behandlung zum Vorscheine komme, läßt sich auch mit Grunde antworten.

Zuvörderst werde ich aus der Kräuterkunde und der Körperlehre als ausgemacht annehmen dürfen, daß der gleichsam auf eine gewaltsame Weise und in einer hohlen Rundung in dem Saamenkorne liegende und eingesperrte, darneben aber mit einer Schnellkraft begabte Keim, eine beständige Neigung habe, und sich wirklich bemühe, eine andere Richtung anzunehmen. Ich werde ferner aus den nämlichen Ursachen für bekannt voraussetzen können, daß diese Bemühung wirksam werde, und eine andere Richtung wirklich erfolge, so bald der Widerstand gehoben worden ist. Man wird es endlich drittens vor ebenfalls schon erwiesen gelten lassen, daß Letzteres durch eine gewisse

Art

Art von Feuchtigkeit und durch einen gewiſſen Grad der Hitze, bald mehr, bald weniger könne befördert und beſchleuniget werden.

Wendet man nun dieſe Sätze auf den gegenwärtigen Fall an, ſo findet ſich, daß die zwo erſtern Bedingungen aus dem vorhergehenden ihre ungezweifelte Richtigkeit haben. Der Keim iſt mit einer Schnellkraft verſehen; er iſt in dem Saamenkorne ganz beſonders eingeſperret und zuſammen gedruckt; er muß alſo eine beſtändige Neigung haben, und eine wirkliche Bemühung anwenden, eine andere Richtung anzunehmen; und dieſe muß wirklich ſo bald erfolgen, als ſein Widerſtand gehoben wird! Es wird alſo nur noch der dritte bedingte Satz zu erweiſen ſeyn.

Daß das Wachs, wenn es ſchmelzet, eine Art flüßiger Feuchtigkeit vorſtellet, wird Niemand in Anſprache nehmen. Wenigſtens wird man es für eine ſolche Flüßigkeit annehmen können, die nicht nur die Saamenkörner auf eine kleine Zeit vor dem Verbrennen bewahret, ſondern ihnen auch in einer ungemein groſſen Geſchwindigkeit einen ſo ſtarken Grad der Hitze ertheilet, als auf eine andere Art eben nicht erfolgen mögte. Denn da das Wachs, wie aus der Naturlehre bekannt iſt, im Sieden einen weit größern Grad der Hitze erlanget, als das ſiedende Waſſer; ſo muß auch dem im ſiedenden Wachſe ſich befindenden Saamenkorne und Keime ein weit größerer Grad der Hitze zu Theile werden, als wenn er im ſiedenden Waſſer lieget. Da ferner dieſes Wachs auf dem glühenden Eiſen faſt in weniger als einem Augenblicke zum Schmelzen und Aufſieden gebracht wird; ſo müſſen auch, in Anſehung des Saamenkornes und des Keimes, diejenigen Veränderungen und Entwickelungen ganz ungemein ſchnell auf einander folgen, die ſonſt bey der ordentlichen Luft- und Sommerwärme, ja ſelbſt im ſiedenden Waſſer, nur nach und nach entſtehen. Da endlich bey gewiſſen Körpern und in gewiſſen Umſtänden durch eine ſchnelle und ſtarke Hitze nicht nur die Schnellkraft vermehret, ſondern zugleich

auch ihr Widerstand vermindert und gehoben werden kann; so trift dieses eben in dem gegenwärtigen Falle zu, und macht begreiflich, wie der Keim in angezeigten Umständen eine solche Gewalt auf einmal überkommen könne, daß er das Saamenkorn ausdehne, die Schaale öffne, und nach Art einer rundgespannten und plötzlich looßgelaßenen Springfeder wegschnelle. So stelle ich mir wenigstens die Sache aus angeführten Ursachen vor!

Damit mich aber gleichwohl Niemand beschuldigen möge, als ob diese erstangeführte Entwickelungsart des Keimes lauter willkührlich angenommene Sätze wären; so will ich dieselbe so gar aus allen Kleinigkeiten der bey dieser Zahncur sich äußernden Umstände, und aus der Gestalt der herausgetriebenen und abgeschnellten Keime selbst erweisen.

Die meisten der vorgeblichen Zahnwürmer haben am Kopfe und an dem Schwanze einen braungelben Punkt oder Flecken *. Was ist dieser anders, als das Merkmaal, wie das Feuer den Keim in der Gegend, wo er dem Knoten anlag, müsse angegriffen und versenget haben? Die meisten dieser Würmer haben eine halbrunde Gestalt **. Ist das nicht ein Anzeigen, nicht nur der natürlichen Laage des Keimes, als er noch im Saamen verschloßen war; sondern auch seiner bey erfolgter Hitze geäußerten Schnellkraft. Die größte Anzahl dieser Würmer sind doppeltschwänzig ***. Ist dieses aber nicht auch den Keimen gemein und eigen, daß sie sich an dem einen Ende theilen! Sie haben eine äußere Haut, und bestehen innerlich aus lauter weißen Kügelgen oder Körnergen †. Sind das nicht die ersten Grundlagen der Pflanzengefäße, der Saft- und Saugröhren, der Knötgen, die auch schon im Keime vorhanden sind? Wird man sich hiebey zugleich erinnern, was ich oben von einem Knattern, Spritzen und Wegschnel-

* Fig. IX. X. XI. b. f. f. ** Fig. I. III. VIII. *** Fig. IX. X.
† Fig. IV. V. VI.

schnellen angeführt habe, welches jedesmal bey dem Schmelzen des Wachses und dem Verbrennen der Judenkirschen beobachtet wird; so ist auch dieses eine Bestättigung meiner Meynung. Ja ich habe wirklich einmal ein solches Saamenkorn unter den andern verbrannten gefunden, wo sich unter dem zerplatzen der Keim nicht ganz entwickelt hatte, und davon man sich aus der Abbildung den besten Begriff machen kann. *

Es erweisen aber alle itzo angeführte Umstände zugleich auch dieses, daß das ganze bey dem Gebrauche dieses Mittels wider die angeblichen Zahnwürmer vorgeschriebene Verfahren in allen Stücken seinen zureichenden Grund habe. Denn da, wie ich aus der angeführten Geschichte als bekannt annehmen kann, durch dieses Mittel nicht etwa blos die Zahnschmerzen gestillet, sondern dadurch zugleich und vornämlich Würmer sichtbar werden sollen; so erfolget Letzteres freylich nicht anders, wenigstens nicht so leicht und sicher, als nach der angegebenen regelmäßigen Vorschrift.

Wollte man Judenkirschen allein, oder die aus ihnen und dem Wachse verfertigten Kügelgen auf Kohlen, oder in ein Kohlpfännigen, werfen; so würde zwar der Rauch entstehen, und die anscheinenden Würmer oder Keime würden sich vieleicht auch manchmal entwickeln und abschnellen; allein, sie würden zugleich auch in die Kohlen zurück fallen, zur Asche werden, und also unsichtbar bleiben. Dieses macht das glühende Eisen hiebey nothwendig, indem die Keime über solches hinüber schnellen, und also unverletzt erhalten werden. Wollte man die Judenkirschen, ohne mit etwas anderm zu vermischen, an und vor sich auf das glühende Eisen legen, so würden sie und ihre Saamenkörner auf demselben eher zusammen brennen, als der Keim sich zu entwickeln und wegzuschnellen im Stande kommen würde. Dieses scheinet das Wachs hie-

* Fig. III. VIII.

hiebey zu erfordern. Wiewohl auch dieſes, vermöge ſeines Rauchs, zur Linderung der Zahnſchmerzen ſelbſt etwas beytragen mag. Wollte man die zubereiteten Wachskügelgen im Freyen auf das glühende Eiſen legen, ſo würden die Würmer, oder entwickelten Keime, viel zu weit weg und auseinander ſpringen, als daß ſie jedesmal, ſonderlich demjenigen ſo gleich zu Geſichte kommen ſollten, der nicht zum voraus weis, daß bey dieſem Verſuche aus den Kügelgen etwas Wurmähnliches wegſpringet. Dieſes Wegſpringen wird durch den umgekehrten Topf verhindert, als an deſſen innern glatten Wand dieſe Würmer oder Keime anprallen, und hierauf innerhalb demſelben niederfallen. Nicht zu gedenken, daß der Topf das Wegſpringen und Herabfallen der Würmer aus den Kügelgen ſelbſt unſichtbar macht, und alſo die Entdeckung des Betrugs um ſo mehr verhütet. Wollte man endlich den Topf mit dem darein geſteckten Eiſen blos auf einen Tiſch, Bogen Pappier, oder dergleichen etwas ſtellen; ſo würde zwar alles gehörig erfolgen, und die Würmer würden ſichtbar werden. Allein, da zugleich der Speichel durch die obere Oeffnung des Topfes hinabgelaſſen wird, ſo würde dieſes einen unreinen und etwas eckelhaften Anblick verurſachen. Dieſem wird durch das Waſſer in der Schüſſel, worein der Topf geſtellet wird, abgeholfen. Wie es denn auch natürlicher ausſiehet, wenn die Würmer auf dem Waſſer ſchwimmen. Und vielleicht kann eine mit Fleiß erregte oder zufällige Bewegung des Waſſers, ſonderlich, wenn nach dem Verſuche der Topf ſchnell in die Höhe gehoben wird, dieſen Würmern gar eine ſolche Bewegung mittheilen, welche die verblendenden Sinne und betäubte Einbildungskraft vor ein wahrhaftes Schwimmen und wirkliches Leben dieſer vermeintlichen Würmer anſehen und erklären mögten.

Iſt dieſes nicht ein recht künſtliches und bey nahe weislich erfundenes Spielwerk? Hat nicht bey dieſem Betrugsmittel alles ſeinen guten Grund und ſeine eigene Urſache? Und mögte es nicht faſt ſchwer

fallen,

fallen, zu bestimmen, ob alle diese Dinge eben so von ohngefähr und zufälliger Weise nach und nach sich begeben haben, oder ob sie mit gutem Bedachte ausgesonnen, und mit einander verbunden worden seyn. So viel Mühe und Fleiß verschwendet der Mensch, um andere zu verblenden, und zu betrügen!

Ich komme nunmehro auf den letzten Umstand, welchen ich nach meinem obigen Versprechen noch zu erörtern habe. Er betrift die Frage: Warum der Gebrauch dieses Hülfsmittels gleichwohl das Zahnwehe lindere, und gar vertreibe, ohnerachtet erwiesenermaßen das Vorgeben von den dadurch sichtbar abgetriebenen Würmern falsch und erdichtet ist? Ich stelle mir diese Wirkungsart ohngefähr so vor, und überlasse eine nähere oder bessere Bestimmung den Arzneygelehrten.

Es ist bekannt, daß die Zahnschmerzen (odontalgia), ob sie gleich überhaupt genommen, insgesammt und allezeit eine widernatürliche Beschaffenheit oder Reitz der Nerven zum Grunde haben, gleichwohl in einzelen Fällen aus gar verschiedenen Ursachen entstehen, und daß sie bald von einer Anhäufung, üblen Beschaffenheit und Stockung der Säfte, bald von einer daher entstandenen gewaltsamen Ausdehnung und Spannung der Gefäße, bald von einer Säure, bald von wirklichen Würmern, und dergleichen, herkommen. Man weis ferner, daß gewisse Arzneymittel eine reitzende und prickelnde Kraft haben (stimulantia), vermöge welcher sie den Zufluß der Säfte zu einem gewissen Orte vermehren; daß andere eine einsaugende und stumpfmachende Kraft haben (absorbentia), vermöge welcher sie die Säure in sich nehmen, einwickeln, und unwirksam machen; und daß noch andere, den Würmern schädlich und tödtlich sind (anthelmintica); Ja, daß es gewisse Mittel giebt, in welchen sich diese verschiedene Kräfte zugleich befinden. Sind aber dergleichen Mittel nicht eben solche, welche den obigen Ursachen der Zahnschmerzen entgegen stehen, und

welche also dieselben zu heben, folglich auch den Schmerz selbst zu lindern und zu vertreiben, vermögen sind? Und sollte es wohl schwer fallen, von unserm Hülfsmittel der Judenkirschen die nämlichen Kräfte zu erweisen? Ich will einen Versuch machen.

Die Judenkirschen * werden ihren eigentlichen Bestandtheilen nach unter die Urintreibenden Mittel (diuretica) gerechnet. Ich glaube aber, daß diese hier in keinen Betracht zu nehmen sind. Denn da nur ihr Rauch dabey wirket, so werden durch die vorhergegangene Verbrennung und Einäscherung ihre sonstigen und wesentlichen Theile viel zu sehr verändert und zerstöhret, als daß sie noch weiters wirken könnten. Wenigstens bin ich in diesem Stücke der Meynung vieler Naturlehrer, die dem Feuer ein solches Zerstöhren zuschreiben. Mich dünket also, daß alle Wirkung dieser Judenkirschen bey Zahnschmerzen allein in demjenigen zu suchen, und davon herzuleiten ist, was durch die Verbrennung in ihnen entsteht und hervor gebracht wird. Dieses ist aber, wie die Chymie lehret, ein wässeriges, öliges und salziges Wesen. Denn dergleichen wird aus allen Körpern im Pflanzen- und Thierreiche durch das Verbrennen und Einäschern hervorgebracht. Das Wasser an sich, und so fern es nicht mit den andern Thei-

* Dieses Kraut wird sonst auch Halicacabus, Physalis, Solanum vesicarium, Solanum halicacabum vulgare, Alkekengi officinarum genannt. Die Pflanze hat eine vollkommene, einzele, regulaire, eindlätterige und Trichterähnliche Blume, und gehöret also unter die zweyte Classe der Tournefortischen Eintheilung. Sie hat einen einzeln Griffel und fünf Staubfäden, und gehöret also, nach dem Linnäanischen Lehrgebäude, unter die erste Abtheilung der fünften Classe (pentandria monogynia). Man giebt insgemein vor, daß der sonst säuerliche und angenehme Geschmack der Kirschen dieser Pflanzen sich in eine höchstunangenehme Bitterkeit verwandele, so bald sie von bloßen Händen angerühret würden. Es bestehet aber der Irthum eigentlich darinn, daß die Schaale, in welcher diese Kirschen liegen, bitter ist, und bey dem Zerreißen derselben, ihre den Fingern sich angesetzte Bitterkeit unvermerkt auch den Kirschen mitgetheilet wird.

Digitized by Google

Theilen vermischet wäre, mögte in Zahnschmerzen von keiner großen Bedeutung seyn. Da es aber mit jenen Theilen allezeit beschwängert ist, und in der Gestalt des Rauches in die Höhe steiget, und an dem leidenden Theil hingeleitet wird, so giebt es gleichsam das Beförderungsmittel (vehiculum) der öligen und salzigen Theile ab. Und diese sind die eigentlichen Theile, worauf es bey dieser Cur ankommt. Das Oel ist durch die Verbrennung zu einem Stinköl (oleum empyreumaticum) geworden; und das Salz gehöret zu den flüchtigen Laugensalzen (sal alcali volatile). Da nun alle Stinköle eine reitzende und prickelnde Kraft haben, und zugleich, wie alle Oele, den Würmern unleidentlich sind; alle Laugensalze aber die Säure in sich nehmen, und ihre schädliche Wirkung schwächen und dämpfen; so wird hoffentlich den verbrannten Judenkirschen und deren Rauche die nämlichen Kräfte und Wirkungen nicht können abgesprochen werden, und es wird also ganz ordentlich und natürlich zugehen, wenn dieses Mittel in gewissen Zahnschmerzen bewähret gefunden wird. Ist eine Stockung der Säfte die Ursache des Zahnschmerzens, so wird der Rauch von diesen verbrannten Judenkirschen, so bald er in den Mund kommt, vermöge seiner öligen Theile die Nerven reitzen und prickeln; es wird, nach dem bekannten Veränderungsgesetze, ein stärkerer Zufluß und eine vermehrte Absonderung des Speichels erfolgen; es wird viel wässeriges Wesen aus dem Munde fließen, die stockenden Säfte werden durch den vermehrten Trieb und die verstärkte Absonderung aufgelöset, verdünnet und damit die Stockung selbst gehoben werden, das heißt, der Zahnschmerzen wird auf einmal gestillet seyn. Fast ein gleiches wird erfolgen, wenn eine widernatürliche Spannung der Nerven den Schmerzen verursachet; die herbey gelockte und stärkere Feuchtigkeit wird eine nachlassende und erweichende Kraft äußern, und dadurch Linderung verschaffen. Ist aber eine gewisse Säure die Veranlassung der Zahnschmerzen, so wird der Rauch, vermöge seiner beschwängerten laugensalzigen Theile, wirken; diese werden die Säure

in sich saugen, einwickeln, und ihnen das Vermögen benehmen, die Nerven weiter zu reitzen und zu prickeln; wiewohl solche Säure zum Theile auch durch den vermehrten Zufluß der Feuchtigkeit geschwächet werden kann. Und wenn sich endlich in den Zähnen wahre und wirkliche Würmer finden sollten, ob sie gleich von anderer Art werden seyn müssen, als die, von welchen ich in dieser Abhandlung geredet habe, so wird sie der ölige Rauch ganz leicht und bald ersticken und tödten.

Dieß ist der Begriff, den ich mir von der natürlichen Wirkung dieser Judenkirschen und Zahnschmerzen mache; ohne jedoch damit denenjenigen vorgreiffen zu wollen, die sie auf eine andere und bequemere Art zu erklären die Geschicklichkeit haben. Indessen läßt sich aus dieser angegebenen natürlichen Ursache noch viererley folgern. Einmal, da dieses Mittel nur vermöge seiner öligen und laugensalzigen Theile in Zahnschmerzen wirket; so kann es unmöglich in allen Zahnschmerzen Nutzen schaffen, und von gutem Erfolge seyn. Und daher hat sich auch bey obigen Versuchen ausgewiesen, daß manchen Personen damit nicht geholfen wurde. Zweytens, da die eigentliche Wirkung dieses Mittels dem Verbrennen und dem Rauche zu zuschreiben; so wird der nämliche Nutzen auch von andern Körpern aus dem Pflanzen- und Thierreiche zu erwarten seyn. Und daher wird auch wirklich der Tobacksrauch, der Rauch vom Pappiere, von allerhand Harzen, und von einer Menge Kräuter, Wurzeln, und dergleichen, für Zahnschmerzen verordnet. Drittens, weil dieses Mittel meistens durch den vermehrten Zufluß der Säfte, oder Einsaugung der Säure, seine Kraft äußert; so wird es bey gewissen Mitteln nicht einmal des Verbrennens nöthig haben. Das bloße Käuen, das Auflegen und Hineinstecken gewisser ziehenden Mittel, ja selbst verschiedene Arten von Kunstgeistern werden das Nämliche bewerkstelligen. Und weil viertens blos der Rauch hiebey das Seine thut; so wird sich

von

von ſelbſt verſtehen, daß alle jene beſondern und ſeltſamen Anſtalten dabey unnütz ſind, und daß, wenn es ſonſt Nutzen ſchaffen kann, ſolcher erfolgen wird, wenn man auch dieſe Judenkirſchen, oder dergleichen andere Kräuter und Saamenkörner, auch nur allein auf Kohlen werfen und ſich damit räuchern wird. So viel von der natürlichen Wirkungsart dieſes Hülfsmittels.

Sollte ſich aber nicht auch noch eine andere Urſache angeben laſſen, warum dieſes Mittel unter den oben angeführten Umſtänden manchmal helfe, wenigſtens geholfen zu haben geglaubet werde? Sollten nicht auch Gemüthsbewegungen, eine bloſe Einbildungskraft und eine lebhafte Vorſtellung hier gar oft etwas ausrichten können. Ich habe dieſem Einfalle nachgedacht, und ihn nicht unwahrſcheinlich gefunden.

Es wird in der Phyſiologie erwieſen, daß die Seele in dem Körper, und der Körper in die Seele, wirke; daß auf gewiſſe Empfindungen der Seelen gewiſſe Bewegungen und Veränderungen im Körper erfolgen, und ſo auch umgekehret; ja daß wirklich gewiſſe lebhaften Eindrücke und Empfindungen der Seele, nach Beſchaffenheit der Umſtände, in dem Körper ein Uebel anrichten, aber auch manches Uebel heben können. Es pfleget weiters daſelbſt dargethan zu werden, daß der Schmerz eine Seelenempfindung (ſenſatio animalis) ſey; daß wir nicht eher einen Schmerz empfinden, als wenn ſich die Seele deſſen auch zugleich bewußt iſt; daß dieſes Bewußtſeyn in gewiſſen Fällen geſchwächet, ja gar verdrenget werden könne; und daß dieſes inſonderheit alsdann geſchähe, wenn bey dem Schmerze ſolche neue Eindrücke und Empfindungen in der Seele entſtehen, die ſtärker als der Eindruck und Empfindung des Schmerzens iſt; ja daß, da ſich die Seele zwoer Dinge zugleich und auf einmal nicht bewußt ſeyn kann, alles dasjenige die Seele von dem Bewußt-

ſeyn und Empfindung des Schmerzens ableiten müſſe, was ſie plötzlich und ganz allein auf eine andere Sache hinziehet, und ſie damit völlig einnimmt. Iſt nicht auf dieſe Weiſe im erſtern Falle Manchem durch ein ſchnell erregtes Lachen ein Geſchwüre aufgegangen, oder durch eine unvermuthete Freude und erregte andere Gemüthsbewegungen von einer Stockung der Säfte Hülfe wiederfahren; und pflegen wir nicht, im andern Falle, bey groſſer Betrübnis, bey ſtarken Kopfarbeiten, in angenehmen Geſellſchaften, und dergleichen, gar vielmal die unangenehme Empfindung oder den Schmerz des Hungers, und andere widernatürliche Unbequemlichkeiten nicht zu empfinden, ob ſie gleich wirklich vorhanden ſind? Und ich ſehe nicht, warum ſich dieſe bydden Fälle nicht auch öfterer, als man glauben mögte, eräußern ſollten, wenn obiges Mittel, ſonderlich an Perſonen gebraucht wird, die ohnedem mit einer allzulebhaften Einbildungskraft begabet ſind. Man überlege hiebey nur folgendes. Wird nicht bey dieſer Cur, nach obgemeldter Geſchichte, den leidenden Perſonen die gewiſſeſte Hoffnung einer augenblicklichen Linderung und Hülfe verſprochen, und dadurch zugleich mehr als eine Gemüthsbewegung rege gemacht? Pfleget man ſich nicht auf Beyſpiele, wo es allezeit ſoll geholfen haben, zu beruffen, und wie ſtark wird das Vertrauen zu nehmen, wenn bey gehaltener Nachfrage, die Beſtättigung erfolget? Verſichert man nicht, die Urſache dieſer Schmerzen ſinnlich zu heben, und zeiget die abgetriebenen Würmer ſelbſt im Waſſer liegen? Was muß die Einbildungskraft hier nicht vor ein Geſchäfte erhalten, und zu was vor einem ſtarken Grade erhöhet werden? Werden nicht vor, unter und nach dem Gebrauche lauter ſolche ungewöhnlichen Anſtalten, Vorkehrungen und Handlungen angewendet, welche die ganze Aufmerkſamkeit der leidenden Perſon an ſich ziehen muß, und wodurch ſich dieſelbe unvermerkt des Schmerzens wird unbewußt werden? Komt, wie es oft geſchehen mag, zu allem dieſem noch ein gewiſſer Streit dazu,

ver-

vermöge deſſen man die Parthey der abgetriebenen Würmer und des Wunderarztes zu vertheidigen ſich genöthigt ſind, ſo werden noch mehr Gemüthsbewegungen rege werden. Und da man aus Beyſpielen weis, daß ein blinder Eifer alles vermag, warum ſollte er natürlich, und mehr als natürlich, nicht auch die Zahnſchmerzen vertreiben, und, wie alle Sinne und Empfindungen, ſo auch das Bewußtſeyn der Zahnſchmerzen betäuben können? Wollte nebſt allen dieſen Jemand auch dieſes vor eine mannigmalige Urſache der Hülfe angeben, daß gewiſſe Leute aus ganz begreiflichen Urſachen, und um nicht ausgelacht zu werden, daß ſie ſo leichtgläubig geweſen, oft wider alle Empfindung blos ſagen, es ſey beſſer geworden; ſo würde ich dabey nichts zu erinnern haben. Wenigſtens mögte es demjenigen, welcher die Welt kennet, nichts Neues, ſondern etwas ſehr gewöhnliches zu ſeyn ſcheinen.

Hiebey könnte ich es bewenden laſſen. Allein es wird mir erlaubet ſeyn, mich noch über diejenigen Geſchichten etwas näher herauszulaſſen, deren in dem erſten Abſchnitte aus den Engliſchen Abhandlungen, und von dem Herrn D. Andry, gedacht worden iſt.

So ſehr die erſtere Geſchichte, ſo der Herr Ritter Sloane angeführet hat, in der Sache ſelbſt und an ſich, mit der meinigen übereinſtimmet, ſo ſehr gehet ſie in dem Gebrauche des Mittels, welches Tollkrauts- oder Bilſenkörner geweſen ſind, und am meiſten darinnen davon ab, daß man wahre und eigentliche Würmer dabey annimt; dieſelbe vor ſolche ausgiebt, die in faulen Käſen leben; und es damit zu erweiſen ſucht, weil derjenige, welchen man erhalten, und dem berühmten Herrn Leeuwenhoek zugeſendet worden iſt, ein wahrer Käſe-

wurm

wurm gewesen sey, und sich in einen dergleichen gewöhnlichen Käfer verwandelt habe. Ich muß es aber offenherzig gestehen, daß mir diese angenommene Meynung und Erklärung ganz und gar nicht wahrscheinlich vorkommt. So viel kann seine Richtigkeit haben, daß der dem Herrn Leeuwenhoek zugesendete Wurm ein Käsewurm mag gewesen, und daraus ein Käsekäfer oder Käsefliege entstanden seyn. Ob aber dieser Wurm einer von denenjenigen gewesen, die jener Charlatan abgetrieben zu haben vorgegeben hat, das ist eine andere Frage; und aus der Erzählung, die Herr Sloane davon ertheilet, läßt es sich so genau nicht absehen. Ich glaube gerad das Gegentheil, und halte dafür, daß gedachter Charlatan nichts weniger als wahrer oder Käsewürmer sich bey seinem Betruge bedienet habe; sondern, daß die von ihm durch den Rauch der Tollkrautskörner vorgeblich abgetriebenen Würmer eben so'che Keime dieser Saamenkörner gewesen, als ich von den Judenkirschen erwiesen habe; und es wird diese Vermuthung aus dem, was ich von diesen Bilsenkörnern bald mit mehrern anführen werde, außer allem Zweifel gesetzet werden. Warum aber dem Herrn Sloane eine Käsemilbe statt der eigentlichen so genannten Würmer gesendet worden ist, kann aus verschiedenen Ursachen geschehen seyn. Vielleicht haben diejenigen, von welchen sich der Herr Sloane einen abgetriebenen Wurm ausgebeten, keinen mehr gehabt, und haben also, um ihm gleichwohl zu willfahren, einen Käsewurm übersendet. Vielleicht hat ein Scherz dabey obgewaltet, oder man hat durch Unterschiebung eines wahren und lebendigen Wurms die Vortreflichkeit und sichere Wirkung des Hülfsmittels, und mithin die gründliche und vorzüglich tiefe Einsicht des berüchtigen Wundermannes außer allem Zweifel setzen wollen. So leicht ist es, selbst bey Untersuchung der Wahrheit und Entdeckung des Betruges, der Wahrheit dennoch zu verfehlen, und betrogen zu werden!

Das

Das Urtheil des Herrn D. Andry über seine Geschichte von abgetriebenen Zahnwürmern ist von gleicher fehlerhaften Beschaffenheit. Dieser hält sich darüber auf, daß aus Tollkrautskörnern auch nur anscheinende Würmer entstehen sollten; er beschuldigt den Foreſtus, daß er ohne Erfahrung rede; er legt es einem andern Schriftsteller noch mehr zur Last, daß er durch eigene Versuche was wurmähnliches wolle herausgebracht haben; er widerspricht diesem Vorgeben durch seine Versuche, und erkläret die ganze Erzählung vor lauter Fabelwerk? Allein, wie sehr können doch auch gelehrte Leute fehlen, einander mishandeln, und sich über Dinge anklagen, darinnen sie oft beyde zugleich recht und unrecht haben.

Herr D. Andry kann recht haben, wenn er behauptet, das von dem Rauche der Bilsenkrautskörner keine wahren Würmer aus den Zähnen abgetrieben werden. Er hat recht, wenn er läugnet, daß der Rauch von Bilsenkörnern, wie man vorgegeben hatte, sich in der Luft verdicke, und in etwas Wurmähnliches verwandele. Er hat recht, wenn er versichert, daß er gesunde und kranke Theile des menschlichen Körpers oder andere Dinge mit Tollkrautskörnern geräuchert, und nachher ins Wasser getauchet habe, ohne jemalen auch nur scheinbare Würmer gesehen zu haben. Aber darinn hat er offenbar unrecht, und sich übereilet, wenn er den Satz, daß aus dem Verbrennen der gedachten Saamenkörner keine Wurmähnlichen Körper zum Vorscheine kämen, an sich und überhaupt läugnet, und für eine Fabel erkläret. Ich kann das Gegentheil versichern, so gar, daß ich gefunden habe, wie sich zu diesem Blendwerke die Bilsenkörner noch besser, als der Saamen von Judenkirschen, schickt. Denn aus erstern entwickeln sich die Keime, als die Würmer, auch ohne Wachs, und wenn sie nur gerad auf Kohlen geworfen werden; welches ich mit Juden-

kirſchen allein, ohne Wachs, nie möglich machen können. Hätte alſo Herr D. Andry nur das Einzige geändert, und, ſtatt die Hände oder andere Körper nach dem Räuchern ins Waſſer zu tauchen, und alsdenn erſt die Würmer zu ſuchen, überhaupt beſſer auf das geachtet, was unter dem Verbrennen hinweg geſprungen wäre, ſo würde er ſcheinbare Würmer genug erblicket haben. Wer davon ein Augen-Zeuge werden will, der nehme nur ein glühendes Eiſen, lege es auf einen rein polirten Stein, werfe Bilſenſaamen auf das glühende Eiſen, und decke es ſchnell mit einem Trichter zu; ſo wird er gewis die Menge Wurmähnlicher Körper unter dieſem Trichter gewahr, aber auch von dem Betruge obgedachter Wunder-cur überzeuget werden.

Er-

Erklärung der Kupfertafel:

Fig. I. Die einfach- und doppeltgeschwänzten vermeyntlichen Zahnwürmer, oder vielmehr die durch die Hitze ausgesprengten Keime des Saamens der Judenkirschen, in natürlicher Größe.

Fig. II. a. Der nierenförmige Saamen der Judenkirschen ebenfalls in natürlicher Größe, ohne Keime.

b. c. Eben derselbe, mit seinem in siedenden Wasser herausgetriebenen und noch ansitzenden Keime.

Fig. III. Ein anderer dergleichen Saamen in natürlicher Größe, und wie sich der Kern Bogenförmig heraus begeben hat.

Fig. IV. und V. Die mehr und weniger vergrößerten scheinbaren Eingeweide der Zahnwürmer, oder vielmehr die innern ersten Grundlagen zur Entwickelung der Saamenblättgen.

Fig. VI. Ein Stück der Haut und der herausgedrückten vermeyntlichen Eingeweide der Würmer, nach einer sehr starken Vergrößerung.

a. a. Die noch ansitzende Haut.

b. Die vermeyntlichen Eingeweide.

Fig. VII. Der Saame der zweyten Figur, vergrößert.

a. Die Saamenschaale.

b. Der Keim.

Fig. VIII. Der Saame der dritten Figur, ebenfalls vergrößert.

a. a. Die Saamenschaale.

b. Der Knoten.

c. Der gegen über bogenförmige herausgetriebene Keim.

Fig. IX. X. XI. Dreyerley Art der anſcheinenden Zahnwürmer, nach der Vergrößerung; und wo die Buchſtaben überall einerley bedeuten.

a. Der Kopf.

b. Das braune Fleckgen, oder der Mund.

c. Der Leib.

d. Die eine ſcheinbare Oeffnung, oder der After.

e. e. Der einfache oder doppelte Schwanz.

f. f. Das braune Fleckgen des Schwanzes, ebenfalls als eine anſcheinende Oeffnung.

Fig. XII. Abbildung der Werkzeuge und der Art, wie ſie bey dem Gebrauche des angeblichen Hülfsmittels wider die Zahnwürmer pflegen geſtellet zu werden.

a. Der irdene Topf.

b. Die eine ſichtbare Seitenöffnung.

c. Die Oeffnung im Boden.

d. d. Das durch die beyden Seitenöffnungen geſteckte Eiſen, auf welchem innerhalb des Topfes die Wachskügelgen liegen.

e. Der durch die Oeffnung im Boden in die Höhe ſteigende Rauch, welcher in den Mund gelaſſen werden ſoll.

f. f. Die Schüſſel mit Waſſer, wo der irdene Topf innen ſtehet, und in welcher die vermeyntlichen Zahnwürmer fallen, und daſelbſt nach der Cur gefunden werden.
